RESEARCH INTERESTS

My research focuses on theoretical foundations for the Mixture-of-Experts (MoE) models where I study the effects of different gating functions (namely the softmax gate, the top-K sparse gate, the dense-to-sparse gate and the sigmoid gate, etc) on the convergence behavior of expert estimation. Based on insights from these results, I aim to design novel gating functions and characterize expert networks which help improve the efficiency and scalability of the MoE applications, including Large Language Models, Multimodal Learning and Parameter-efficient Fine-tuning (including prompt-based tuning and adapter-based tuning). Additionally, I am also interested in Optimal Transport theory.
